CHILDREN'S BOOKS

In association with the
Natural History Museum, London

Oviraptor

I eat cones, shellfish and nuts -
cracking eggs can be tasty too.
Best of all, a fat crunchy beetle,
snatched from the top
of a dinosaur poo.

Oviraptor

(Oh-vee-rop-tor)

- Lived 85 - 75 million years ago
- Nose to tail: 1.8 metres
- Omnivore

Oviraptor stood on two legs and was a fast emu-sized dinosaur.

Nobody is sure what Oviraptor ate but it was probably omnivorous, eating both plants and meat.

Using its strong beak, it could easily have crushed nuts, bones, insects, eggs and shellfish.
