CHALK, ICE AND BONES

Dmytryk saw his friends from afar – they'd gathered by the secret cliff. There it was: Aliye's black hair, Sashko's tuft of red hair and Yasia's chestnut plaits with purple strands. His three friends were peering at something in the grass.

"You're late," Sashko grumbled.

Dmytryk whipped out his phone:

"Mama called."

His mother fought in the 57th Motorized Infantry Brigade in the east of Ukraine, and you never knew when she would get another chance to call her loved ones.

His friends nodded. Mama was a good enough reason to be late.

"Look what we've found on the lake shore," Yasia said, gesturing

toward the grass. "Do you know what that might be?"

Dmytryk looked at two rocks.

"My grandpa called them devil's fingers," he said, pointing at the longish one.

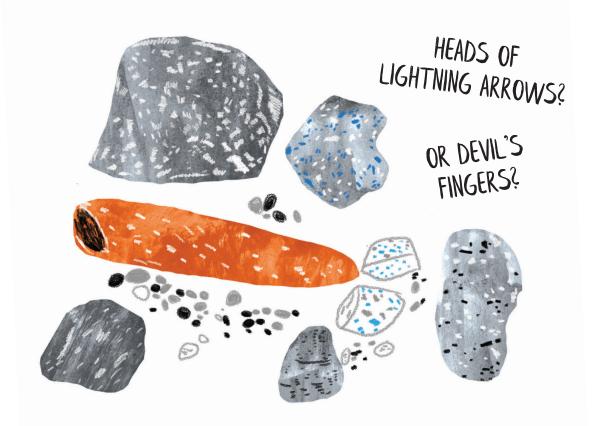

"And my grandma said they were the heads of lightning arrows. But I guess they're neither."

Aliye ran her fingers along their find thoughtfully.

"I think I know who can tell us about them," she said.

Back at the holiday camp, Aliye shouted:

"Da-a-a-dy!"

"What happened, *kızım* (meaning 'my daughter' in Crimean Tatar)?" a man with glasses said, looking out of a pavilion in the park.

"Do you know what these are?" Aliye dashed to the pavilion like an arrow. Her friends tagged along.

"I do," her father nodded. "These are mollusc fossils."

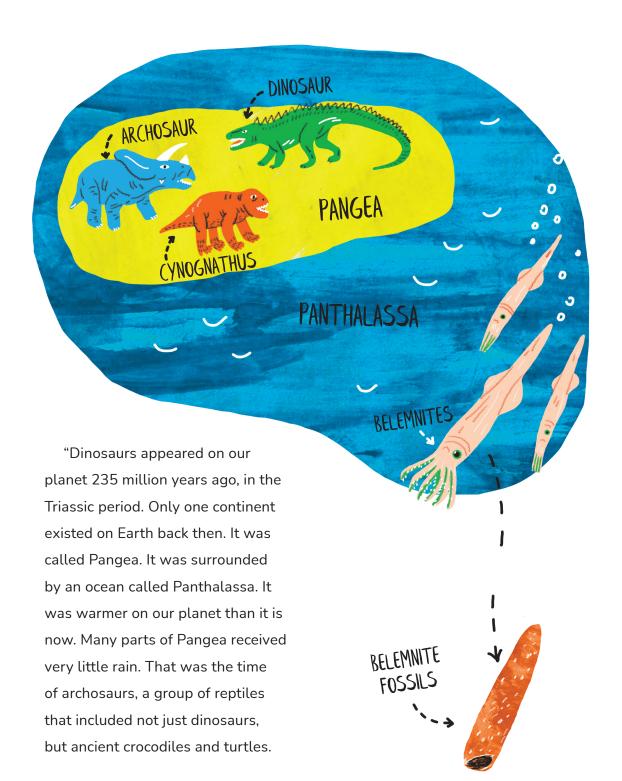

"Fossils?" Sashko said, perking

up. "From the dinosaur era? Perhaps these are fossils of dinosaurs, not molluscs. Mister Rustem?"

"But what kind of dinosaurs lived here?" Yasia cut him short.

"Textbooks don't mention specific species!" Dmytryk said, getting excited.

"Alright," Rustem said, interrupting them. "I'll tell you the whole story. Come on over here, sit down.

The first turtles, dinosaurs and mammals appeared. And there were belemnites swimming in the seas. Those molluscs looked like squids, and these oblong rocks are belemnite fossils."

"But we are in the Cherkasy region, which is in the middle of Ukraine," Sashko said, frowning. "How would marine creatures end up here?"

Rustem laughed.

"Of course, the sea is far away now. But it wasn't always like that. In the Triassic

LAURASIA

period, there was only one continent, so much of what is now land was under the sea. And in the Jurassic era, the next period that started about 201

million years

ago, Pangea split apart to form two continents: Laurasia and Gondwana. New oceans appeared, such as the Atlantic. It was during the Jurassic period that the first birds and early mammals appeared, and ammonites lived in the ocean and seas. It was a kind of squid mixed with a snail."

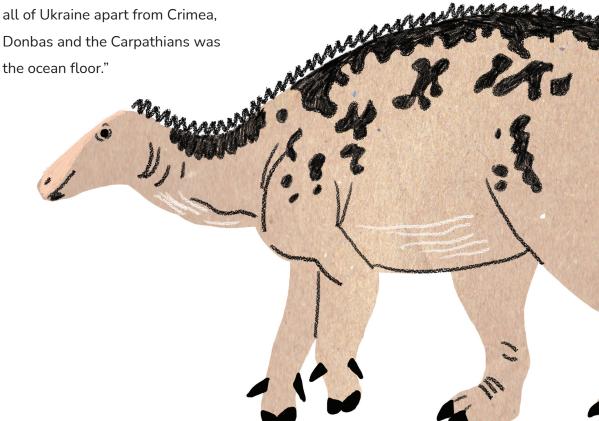

The children giggled.

"The Jurassic period was followed by the Cretaceous period, roughly **145 million years ago**. Back then, all of Ukraine apart from Crimea, Donbas and the Carpathians was "And what about dinosaurs?"

Dmytryk asked. "The Jurassic period was the dinosaur era, for sure."

"Only two species have been found in Ukraine. Both in Crimea.
Only one of them could be identified. It was a herbivore called Riabininohadros."

"Never heard of it," Sashko declared in the sceptical tone of a dinosaur expert.

"It's a close relative of Iguanodon."

"Well, if you say so..." Sashko said thoughtfully and pulled up a browser on his smartphone to check out those Iguanodons.

"And who lived in the water? I mean apart from those ... belemnites and ammonites?" Aliye spoke up.

"Oh, many different creatures at different times. Huge rays and

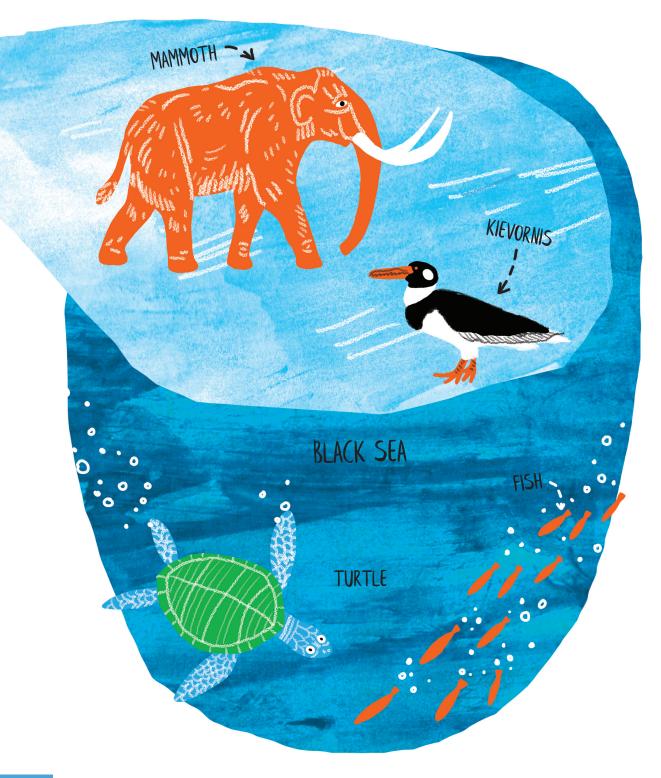

sharks. Also, plesiosaurs and mosasaurs – giant marine reptiles. Sea crocodiles."

"Why did they die out?" Yasia wondered.

"Because a meteorite fell on Earth," Sashko explained.

"It's just one of the hypotheses,"
Rustem said. "According to another
one, the species died out during
the Cretaceous period as a result
of earthquakes and volcanic
eruptions. Another less popular
theory blames flowering plants:
they spread across the planet,

displacing conifers and ferns. The herbivorous dinosaurs couldn't eat them and died out. And then the predators that hunted those herbivores died out, too."

"Oh, I see ... and what happened after the dinosaurs died out?" Yasia wondered.

"The Cenozoic era began. The continents started to look similar to the ones we have now. The entire south of Ukraine was the large, shallow Paratethys Sea, home to fish, turtles and salamanders.

Ancient sea birds nested on its shores. Their fossils are often found in the Luhansk region. The Paratethys Sea dried up and then filled with water again several times until it vanished six million years ago, leaving behind the Aral

and Caspian Lakes, as well as the Black Sea Lake, which later became the Black Sea.

"The planet became much colder. Ice ages occurred from time to time, bringing freezing temperatures.

Huge glaciers on the poles spread much further than now – up to the borders of Ukraine. There were five ice ages in total."

"So, that's when mammoths lived in Ukraine?" Aliye asked.

"Exactly. And not only them. Cave bears, lions, hyenas, woolly rhinos, as well as hamsters, hares and various birds lived here, too."

"Why did they all die out? Because it grew warmer?"

"There are many theories. Some say that people hunted them, others

blame the warming. I prefer a new version: the entire ecosystem was built around the mammoths, so when they vanished, everything else disappeared, too. And the mammoths were wiped out by an epidemic."

"The world became quite similar to the one we know now. Except that saiga antelopes and wild goats

"And what happened afterward?"

lived in the forests." (These were two of numerous extinct species.)

"I'm wondering when humans appeared here," Yasia said, turning the ammonite over and over in her hands. "It's millions of years that we're talking about. The continents changed shape. The seas dried up or formed.

AFRICA

Did it all happen without humans?"

"I don't study humans," Rustem said, and shrugged. "But we are a very young species, indeed. As far as I remember, the earliest members of the genus Homo (the earliest human-like creatures) originated in Africa about 2.4 million years ago. Researchers call them Homo habilis. And Homo sapiens, to which all modern humans belong, appeared around 300,000 years ago. They reached the Ukrainian lands even

HOMO HABILIS

later ... well, I'm sure your history teachers will tell you all about it."

The children looked at one another. Aliye and Dmytryk, who had just finished the fifth grade, mumbled:

"Oh yeah. Teachers will tell us, for sure."

"Let's do some research and write our own history book! A fascinating one, not another boring textbook."

"Let's create a page on social media instead!" Dmytryk said, picking up on her idea. "It's easier, and its followers would be able to add info. We can even make a game. A quest! The page could be called 'A Cool History of Ukraine'!"

"Sounds interesting, guys, but we all go back to our hometowns in a week," Sashko said, sceptical as always. "You won't travel that often from Zaporizhzhia to Kropyvnytskyi, let alone to Ivano-Frankivsk or Chernihiv."

"We can meet online. Our parents will help us." Aliye turned to Rustem. "Won't you?"

"Of course," Rustem said, hugging his daughter.

HOMO SAPIENS
